

THE IT BREAK-FIX MANUAL: MASTER OPERATIONS LOG

Lead Systems Specialist: Abdoulaye Sidibe | Portfolio: [://substack.com](http://substack.com)

A comprehensive enterprise archive documenting end-to-end root-cause analysis, system recovery, and infrastructure triage mapped across both Command-Line Interfaces (CLI) and Graphical User Interfaces (GUI).

MASTER INCIDENT TRIAGE MATRIX

Code	Subsystem	Unified Triage & Multi-Path Remediation Methodology
INC-001	Network Layer (DHCP Outage)	CLI Path: Executed ipconfig /release and /renew (Windows) or dhclient -r (Linux) to purge corrupted software configurations. GUI Path: Access VirtualBox Devices -> Network -> Network Settings to toggle 'Cable Connected' state to isolate hardware boundary links.
INC-002	Identity/Access (Active Directory)	CLI Path: Bypassed administrative locks instantly via net user [username] /active:yes /unlock. GUI Path: Navigated via Computer Management -> Local Users and Groups -> Users to visually audit profile attributes.
INC-003	Storage & Volume (Disk Partition)	CLI Path: Launched low-level partitioning tracks via diskpart -> list volume, executing structural file system validation and recovery sequences using chkdsk C: /f /r. GUI Path: Managed volumes via Disk Management (diskmgmt.msc).
INC-004	Operating System (Bare-Metal OS)	Remediation: Resolved critical environment file corruption. Deployed external installation infrastructure using Rufus to flash a verified Windows 11 Pro ISO onto flash storage. Executed complete destructive drive re-partitioning and clean OS deployment.
INC-005	Peripherals (Print Queue)	CLI Path: Forced print queue terminations via net stop spooler, manually purging the cache directory via root commands, and restarting the engine via net start spooler. GUI Path: Navigated via Services.msc -> Print Spooler -> Restart.
INC-006	Name Resolution (DNS Transport)	CLI Path: Cleared domain translation bottlenecks using ipconfig /flushdns, verifying name resolution routing paths using nslookup queries. GUI Path: Navigated via Network and Sharing Center -> Adapter Settings.

KEY TECHNICAL REMEDIATION STRINGS:

```
[DHCP Triage] ipconfig /release && ipconfig /renew | dhclient -r && dhclient eth0
[Account Unlock] net user [username] /active:yes /unlock
[Disk Repair] diskpart -> list volume | chkdsk C: /f /r
[Printer Spooler Purge] net stop spooler -> del /Q /F /S spool\PRINTERS\* -> net start spooler
[DNS Flush] ipconfig /flushdns -> nslookup [domain]
```
