

THE IT BREAK-FIX MANUAL: MASTER OPERATIONS LOG

Lead Systems Specialist: Abdoulaye Sidibe | Portfolio: [://substack.com](https://substack.com)

A comprehensive enterprise archive documenting end-to-end root-cause analysis, system recovery, and infrastructure triage mapped across both Command-Line Interfaces (CLI) and Graphical User Interfaces (GUI).

MASTER INCIDENT TRIAGE MATRIX

Code	Subsystem	Unified Triage & Multi-Path Remediation Methodology
INC-001	Network Layer (DHCP Outage)	CLI Path: Executed ipconfig /release and /renew (Windows) to flush corrupted temporary software configuration layers. GUI Path: Access VirtualBox Devices -> Network -> Network Settings to toggle 'Cable Connected' state to isolate hardware boundary links.
INC-002	Identity/Access (AD / RBAC)	CLI Path: Provisioned secure domain containers via PowerShell using New-ADGroup and complex user profiles via New-ADUser with complexity rules, linking identity loops cleanly via Add-ADGroupMember parameters. GUI Path: Expand nosstradamis.local tree ➡ Expand Users container ➡ Right-click target security group ➡ Select Properties ➡ Open Members tab ➡ Click Add to bridge accounts visually (Bill Fof & N'dia Malick).
INC-003	Storage & Volume (Disk Partition)	CLI Path: Launched low-level partitioning tracks via diskpart -> list volume, executing structural file system validation and recovery sequences using chkdsk C: /f /r. GUI Path: Managed volumes via Disk Management (diskmgmt.msc) to format raw space visually.
INC-004	Operating System (Bare-Metal OS)	Remediation: Resolved critical environment image file corruption. Deployed external installation infrastructure using Rufus to flash a verified Windows 11 Pro ISO onto storage. Executed complete destructive drive re-partitioning and clean OS deployment.
INC-005	Peripherals (Print Queue)	CLI Path: Forced print queue terminations via net stop spooler, manually purging the corrupted spool data cache via root delete commands, and restarting the engine via net start spooler. GUI Path: Navigated via Services.msc -> Print Spooler -> Restart to clear data blocks.
INC-006	Name Resolution (DNS Transport)	CLI Path: Cleared domain translation bottlenecks using ipconfig /flushdns, verifying name resolution routing paths using nslookup queries. GUI Path: Navigated via Network and Sharing Center -> Change Adapter Settings -> IPv4 Properties.

■ KEY TECHNICAL REMEDIATION STRINGS:

```
[DHCP Triage] ipconfig /release && ipconfig /renew
[AD Group Deployment] New-ADGroup -Name 'Finance_Dept_SG' -GroupScope Global -GroupCategory Security
[AD User Complexity Provisioning] New-ADUser -Name 'Bill Fof' -SamAccountName 'bfof' -AccountPassword $SecurePassword -Enabled $true
[AD Member Nesting] Add-ADGroupMember -Identity 'Finance_Dept_SG' -Members 'bfof', 'nmalick'
[Printer Spooler Purge] net stop spooler -> del /Q /F /S spool\PRINTERS\* -> net start spooler
[DNS Flush] ipconfig /flushdns -> nslookup [domain]
```
