

THE IT BREAK-FIX MANUAL: LIVE OPERATIONS LOG

Lead Tier-2 Systems Specialist: Abdoulaye Sidibe | Portfolio: [://substack.com](#)

A comprehensive operational log detailing real-world root-cause analysis, hardware failure isolation, and system recovery procedures.

INCIDENT TRIAGE ARCHIVE MATRIX

Incident Code	Target Subsystem	Root Cause & Resolution Metric
INC-001 (Resolved)	Network Layer (Linux/Windows DHCP)	Simulated adapter outages. Applied physical layer check logic. Restored connectivity parameters natively via administrative lease terminations and renewals (ipconfig /release and /renew).
INC-002 (Resolved)	Identity Management (Active Directory)	Resolved user account brute-force protection lockout failures. Used targeted command line parameters (net user [username] /active:yes /unlock) to break security blocks without modifying credential configurations.
INC-003 (Resolved)	Storage & File Systems (Disk Subsystem)	Audited logical partitioning tracks and hard volume boundaries using diskpart. Deployed deep structural file system repair scans via volume parameters (chkdsk C: /f /r).
INC-004 (Resolved)	Operating System (Bare-Metal Deployment)	Diagnosed critical system image file corruption. Flashed a verified Windows 11 Pro ISO onto storage using Rufus. Executed complete destructive drive re-partitioning and clean OS deployment.
INC-005 (Resolved)	Peripherals / Print Stack (Logical Spooler Lock)	Remediated local print job freeze blocks. Executed administrative service terminations (net stop spooler), purged corrupted spool data directories via system root controls, and re-initialized the print queue engine successfully.

MASTER TECHNICAL REMEDIATION COMMANDS LOGGED:

```
ipconfig /release && ipconfig /renew
net user [username] /active:yes /unlock
diskpart -> list disk -> list volume -> chkdsk C: /f /r
Rufus -> Windows 11 Pro ISO Bare-Metal Flashing & Deployment
net stop spooler -> del /Q /F /S spool\PRINTERS\* -> net start spooler
```
