THE IT BREAK-FIX MANUAL: MASTER OPERATIONS LOG

Lead Systems Specialist: Nosstra Damis | **Portfolio:** ://substack.com

A comprehensive enterprise archive documenting end-to-end root-cause analysis, system recovery, and perimeter firewall remediation across virtual laboratory network interfaces.

MASTER INCIDENT TRIAGE MATRIX

Code	Subsystem	Unified Triage & Multi-Path Remediation Methodology
INC-001	Network Layer (DHCP Outage)	**CLI Path:** Executed ipconfig /release and /renew to flush corrupted temporary software configuration layers. **GUI Path:** Toggled 'Cable Connected' options inside VirtualBox network properties to reset physical links cleanly.
INC-004	Security Ops (Scareware Script)	**Root Cause:** Isolated a malicious browser full-screen script generating fake antivirus alerts to induce unauthorized telemetry downloads. **Remediation:** Enforced strict network layer isolation by physically decoupling the Cat6 Ethernet link. Executed process termination via taskkill /f /im chrome.exe.
INC-005	SecOps / Triage (Persistence)	**Root Cause:** Identified a hidden startup loop disguised as updater.exe in AppData\Local\PulseSoftware forcing full-screen kiosk popups. **Remediation:** Disabled the startup entry via Task Manager, terminated active process memory rails via CLI, and shift-deleted the execution binary directories.
INC-006	Perimeter Security (Host Firewall CLI)	**Objective:** Fortified Windows Server 2022 perimeter defenses against malicious network scanning and ransomware lateral movement vectors. **Remediation:** Imported network security dependencies via Import-Module NetSecurity. Deployed an inbound port rule targeting TCP Port 445 (SMB) using New-NetFirewallRule to completely drop ransomware traffic paths. Implemented a host containment rule to block a malicious attacker IP address (192.168.1.99) from communicating with the server.

■ MASTER SECURE REGISTRY REMEDIATION COMMANDS LOG:

```
[Host Firewall Port Lockdown] New-NetFirewallRule -DisplayName 'LAB_Block_SMB_Malware' -Direction Inbound -LocalPort 445 -Protocol TCP -Action Block

[Host Firewall Host Containment] New-NetFirewallRule -DisplayName 'LAB_Block_Rogue_Attacker' -Direction Inbound -RemoteAddress '192.168.1.99' -Action Block

[Host Firewall Verification Pass] Get-NetFirewallRule -DisplayName 'LAB_Block_SMB_Malware' | Select-Object Name, Action, Enabled
```
